Comp 302 Final

Concepts

```
let curry f = (\mathbf{fun} \times \mathbf{y} -> f(\mathbf{x}, \mathbf{y}))
let curry2 f x y = f (x, y)
let curry3 = fun f -> fun x -> fun y -> f(x, y)
let uncurry f = (fun(x, y) -> f x y)
(* \ Functions \ are \ right \ associative \ *)
(* Functions are not evaluated until they need to be *)
let test a b = a * a + b
test 3 = \text{fun y} -> 3 * 3 + y (* Not 9 + y *)
Syntax
Do not forget about 'rec', 'let ... in', brackets,
constructors or tuples
match x with
  | a \rangle (* return *)
  | b \rangle (* Nested matching *)
    begin match ... with
     | ... ->
    end
  | -> (* wildcard return *)
let name arg1 arg2 =
  let inner' arg1' arg2' = out' in
  inner' arg1 arg2
exception Failure of string
raise (Failure "what_a_terrible_failure")
let x = 2 and y = 4 (* Initializes both *)
(* ('a * 'b -> 'c) -> 'a -> 'b -> 'c = < fun> *)
let cur = fun f \rightarrow fun x \rightarrow fun y \rightarrow f (x,y)
(* 'a list list -> 'a list = < fun> *)
let first lst = match lst with
  | | | -> | | x :: xs -> x
(* An anonymous 'function' has only one argument,
and can be matched directly without match ... with
val is\_zero : int -> string = < fun> *)
let is_zero = function | 0 -> "zero" | _ -> "not_zero"
(* Variable bindings are overshadowed;
bindings are valid in their respective scopes *)
let m = 2;; let m = m * m in m (* is 4 *);
m (* is 2 *);; let f () = m;; let m = 3;; f () (* is 2 *);;
List Ops
elem :: list
                     list1 @ list2
val length: 'a list -> int
```

val find_opt : ('a \rightarrow bool) \rightarrow 'a list \rightarrow 'a option val filter : ('a \rightarrow bool) \rightarrow 'a list \rightarrow 'a list val map : ('a \rightarrow 'b) \rightarrow 'a list \rightarrow 'b list

val for_all : $('a \rightarrow bool) \rightarrow 'a list \rightarrow bool$

val fold_right : ('a -> 'b -> 'b) -> 'a list -> 'b -> 'b

val exists : $('a \rightarrow bool) \rightarrow 'a list \rightarrow bool$ val rev : 'a list \rightarrow 'a list

 $\mathbf{val} \;\; \mathrm{init} \;\; : \;\; \mathrm{int} \;\; - > (\mathrm{int} \; - > \; \mathrm{`a} \;) \;\; - > \; \mathrm{`a} \; \mathrm{list} \;\; (* \; by \; index \; *)$

Types & Option

```
State theory and IH; do base case
(* Base types: bool, int, char, float, 'a list, option *)
                                                                let rec even_parity = function
(* 'x denotes a polymorphic type (Java Generics) *)
                                                                    [] -> false
type 'a option = None | Some of 'a
                                                                    true::xs -> not (even_parity xs)
(* Constructors can be used to match within types
match cases are sufficient once all constructors are matched *) | false::xs -> even_parity xs
type rational = Integer of int
                                                                let even_parity_tr l = let rec parity p = function
